

# Technical Solutions Delivery Certificate (Systems Analyst)

This certificate works to bridge the gap of understanding between the Project and Technology world. This certificate was inspired by a local state agency to provide a more effective working environment. The agency sent the first cohort through, and 12 participants earned their certificate.

These classes are set up to give various groups of people the ability to understand concepts from the other perspective, ultimately providing a common language and communication to help in the success of the work from both ends. The classes are structured as 1-2 days in length to provide an overview and get you back to your role so you can immediately use the knowledge you obtain in class! Take one class that may apply to your work or take them all to have a complete overview.
